

# E-commerce django project

This is my final milestone project for Code Institute. This project is based on creating a e-commerce website using HTML, CSS, JavaScript, python and Django. In other word, it will be about creating a full-stack framework website. For my website, i will selling cameras to customers that are interested in photography whether they can take pictures for leisure or for work. I imagined myself having this business because every day people like to take pictures and it is very satisfying. I'm hoping to provide good quality cameras for customers. Nowadays e-commerce is already massively around the world and it is making a huge impact for all businesses alike around the world. As a developer. I need to make sure that all customers will receive the best service so that they have the opportunity to buy the product they need for themselves.

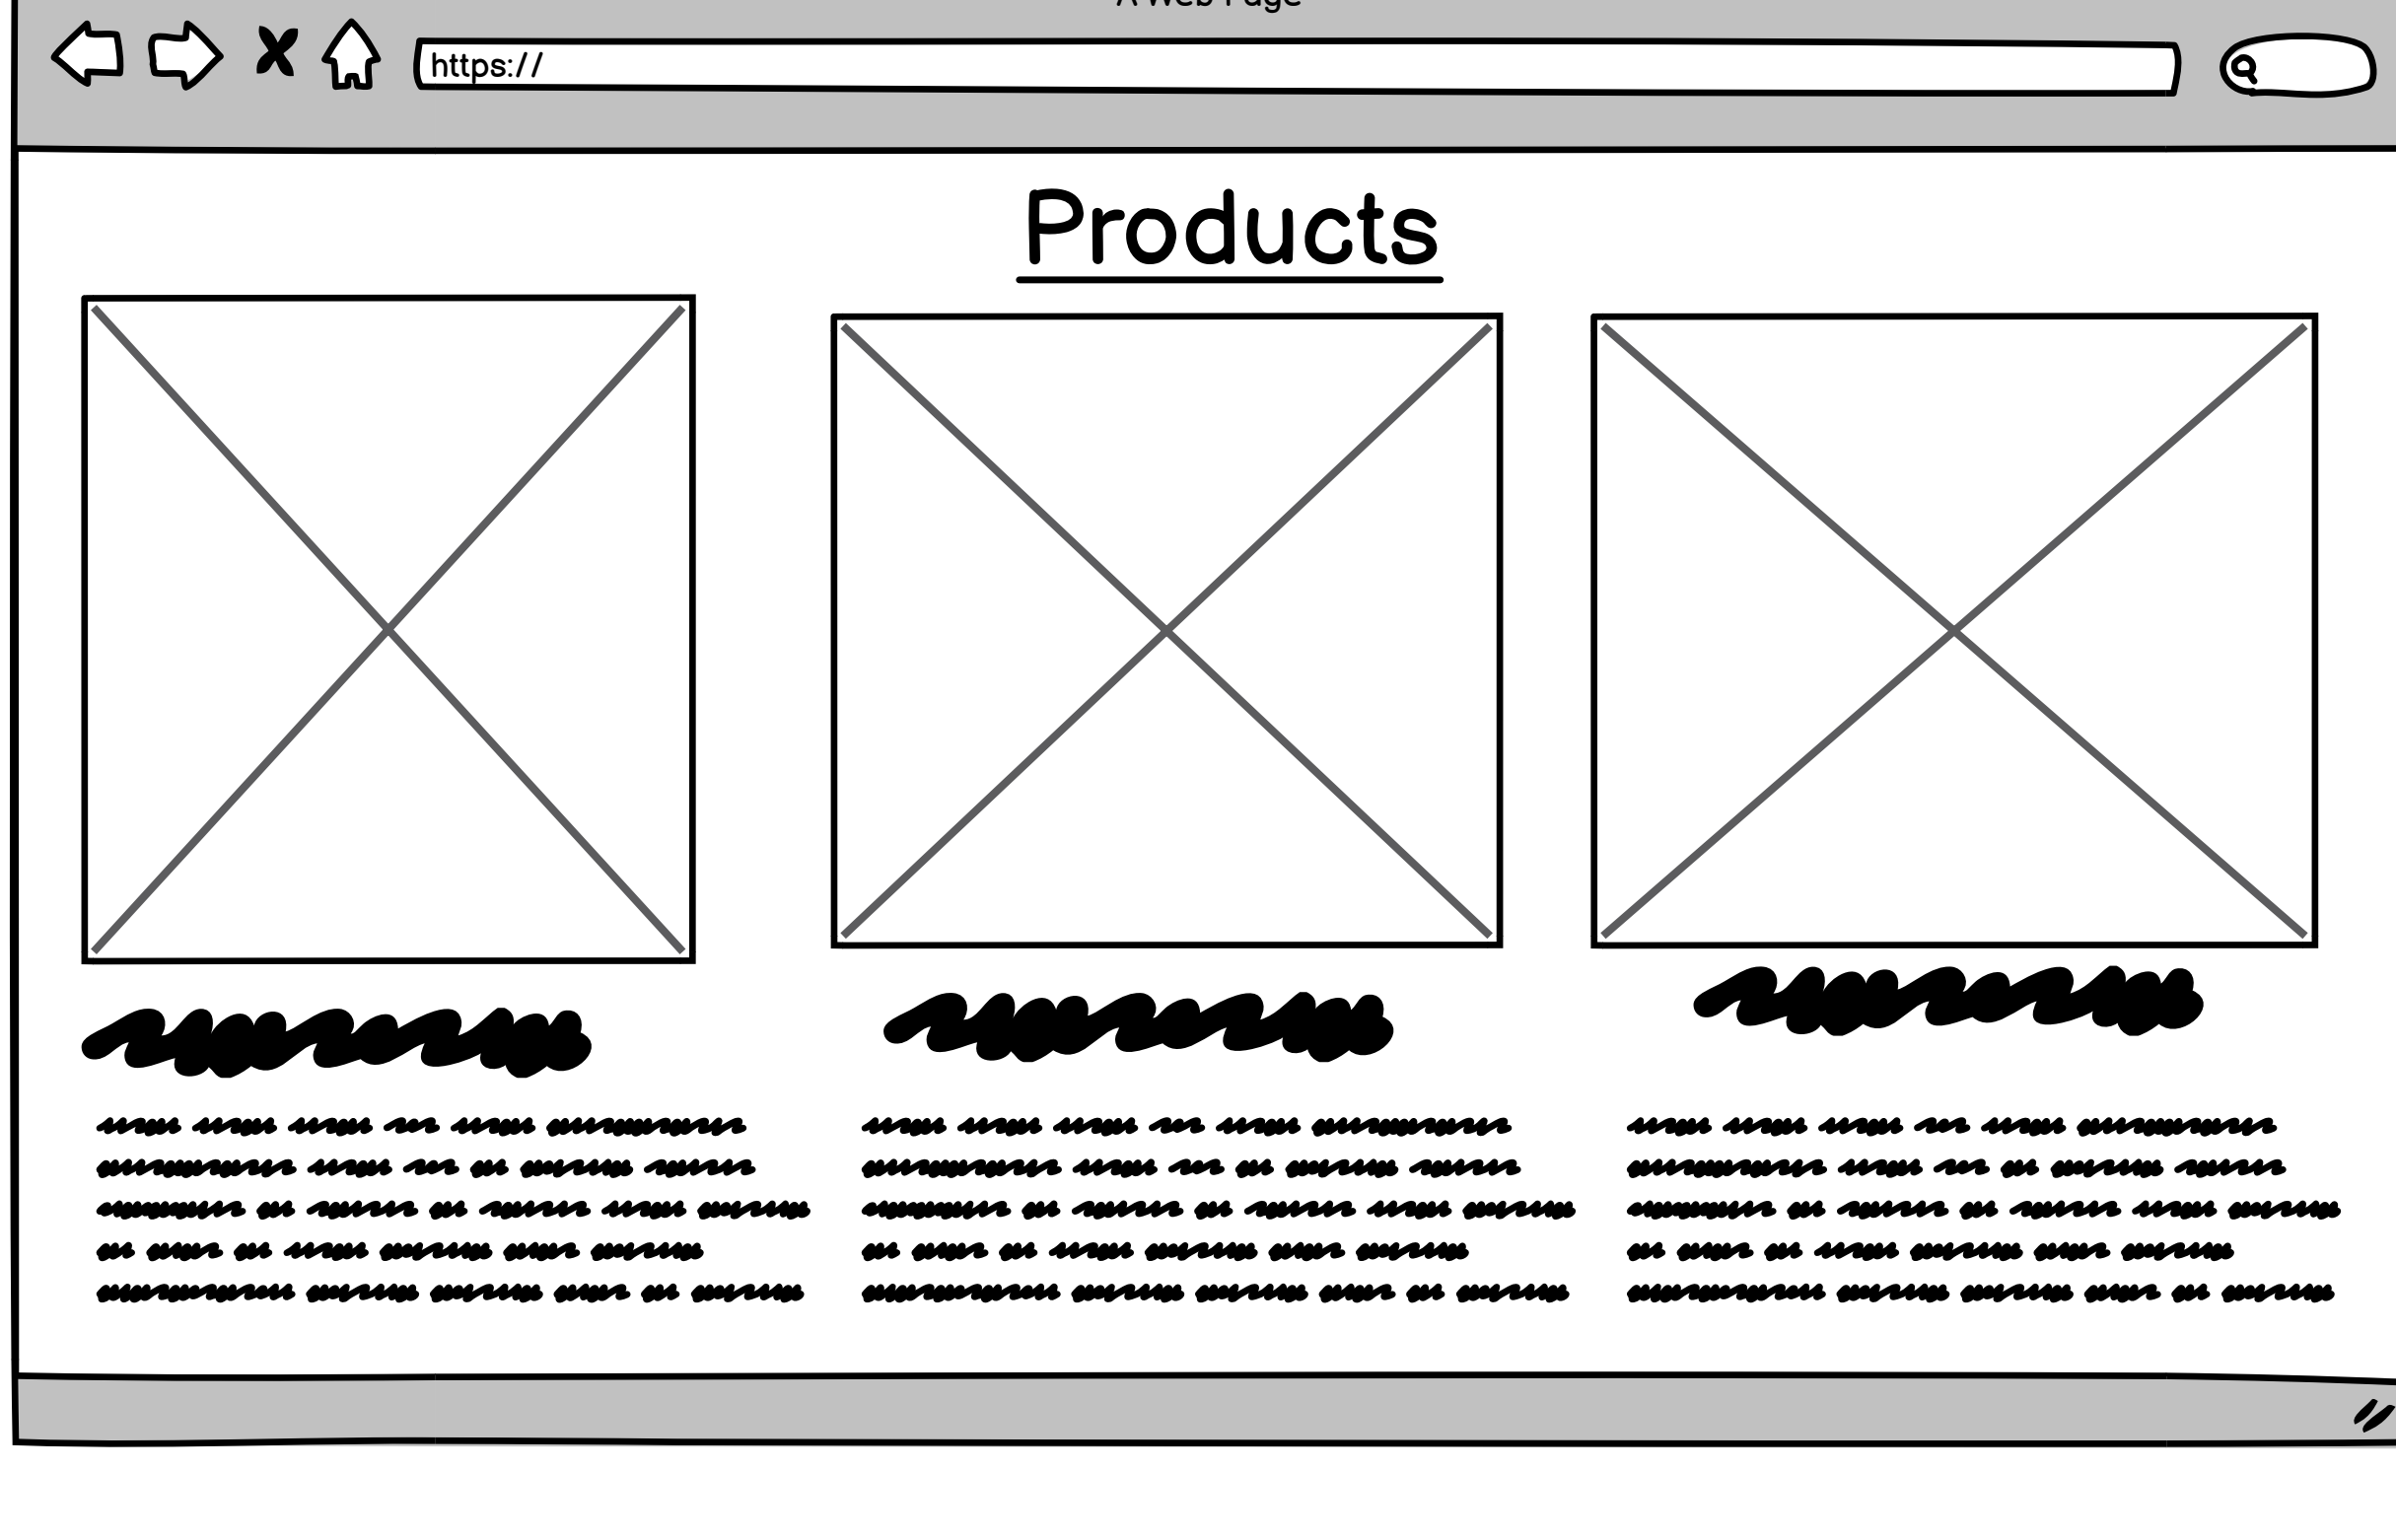

## Sitemap for the e-commerce

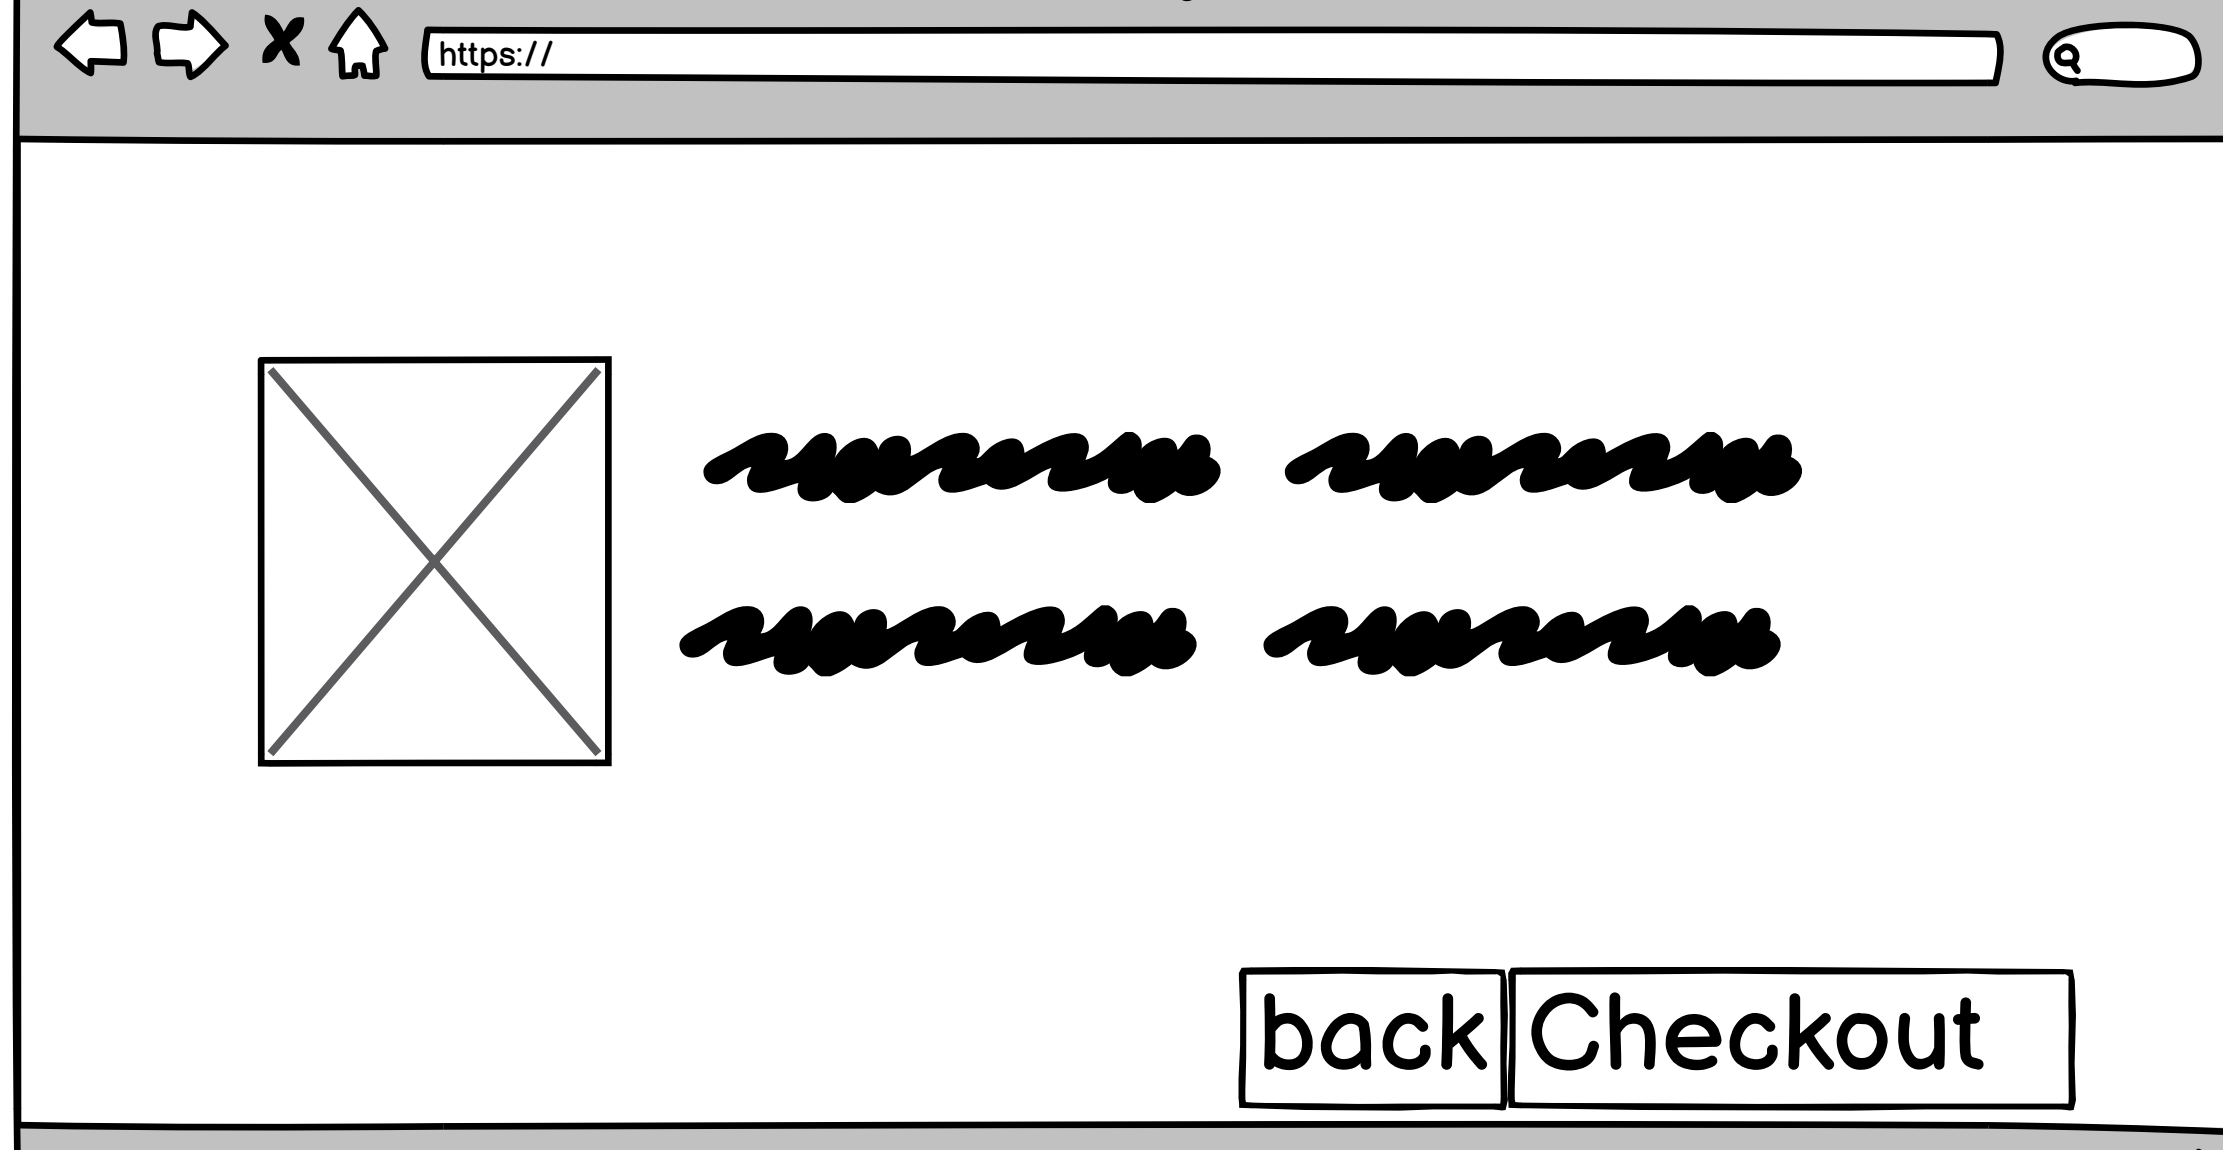

## Homepage design

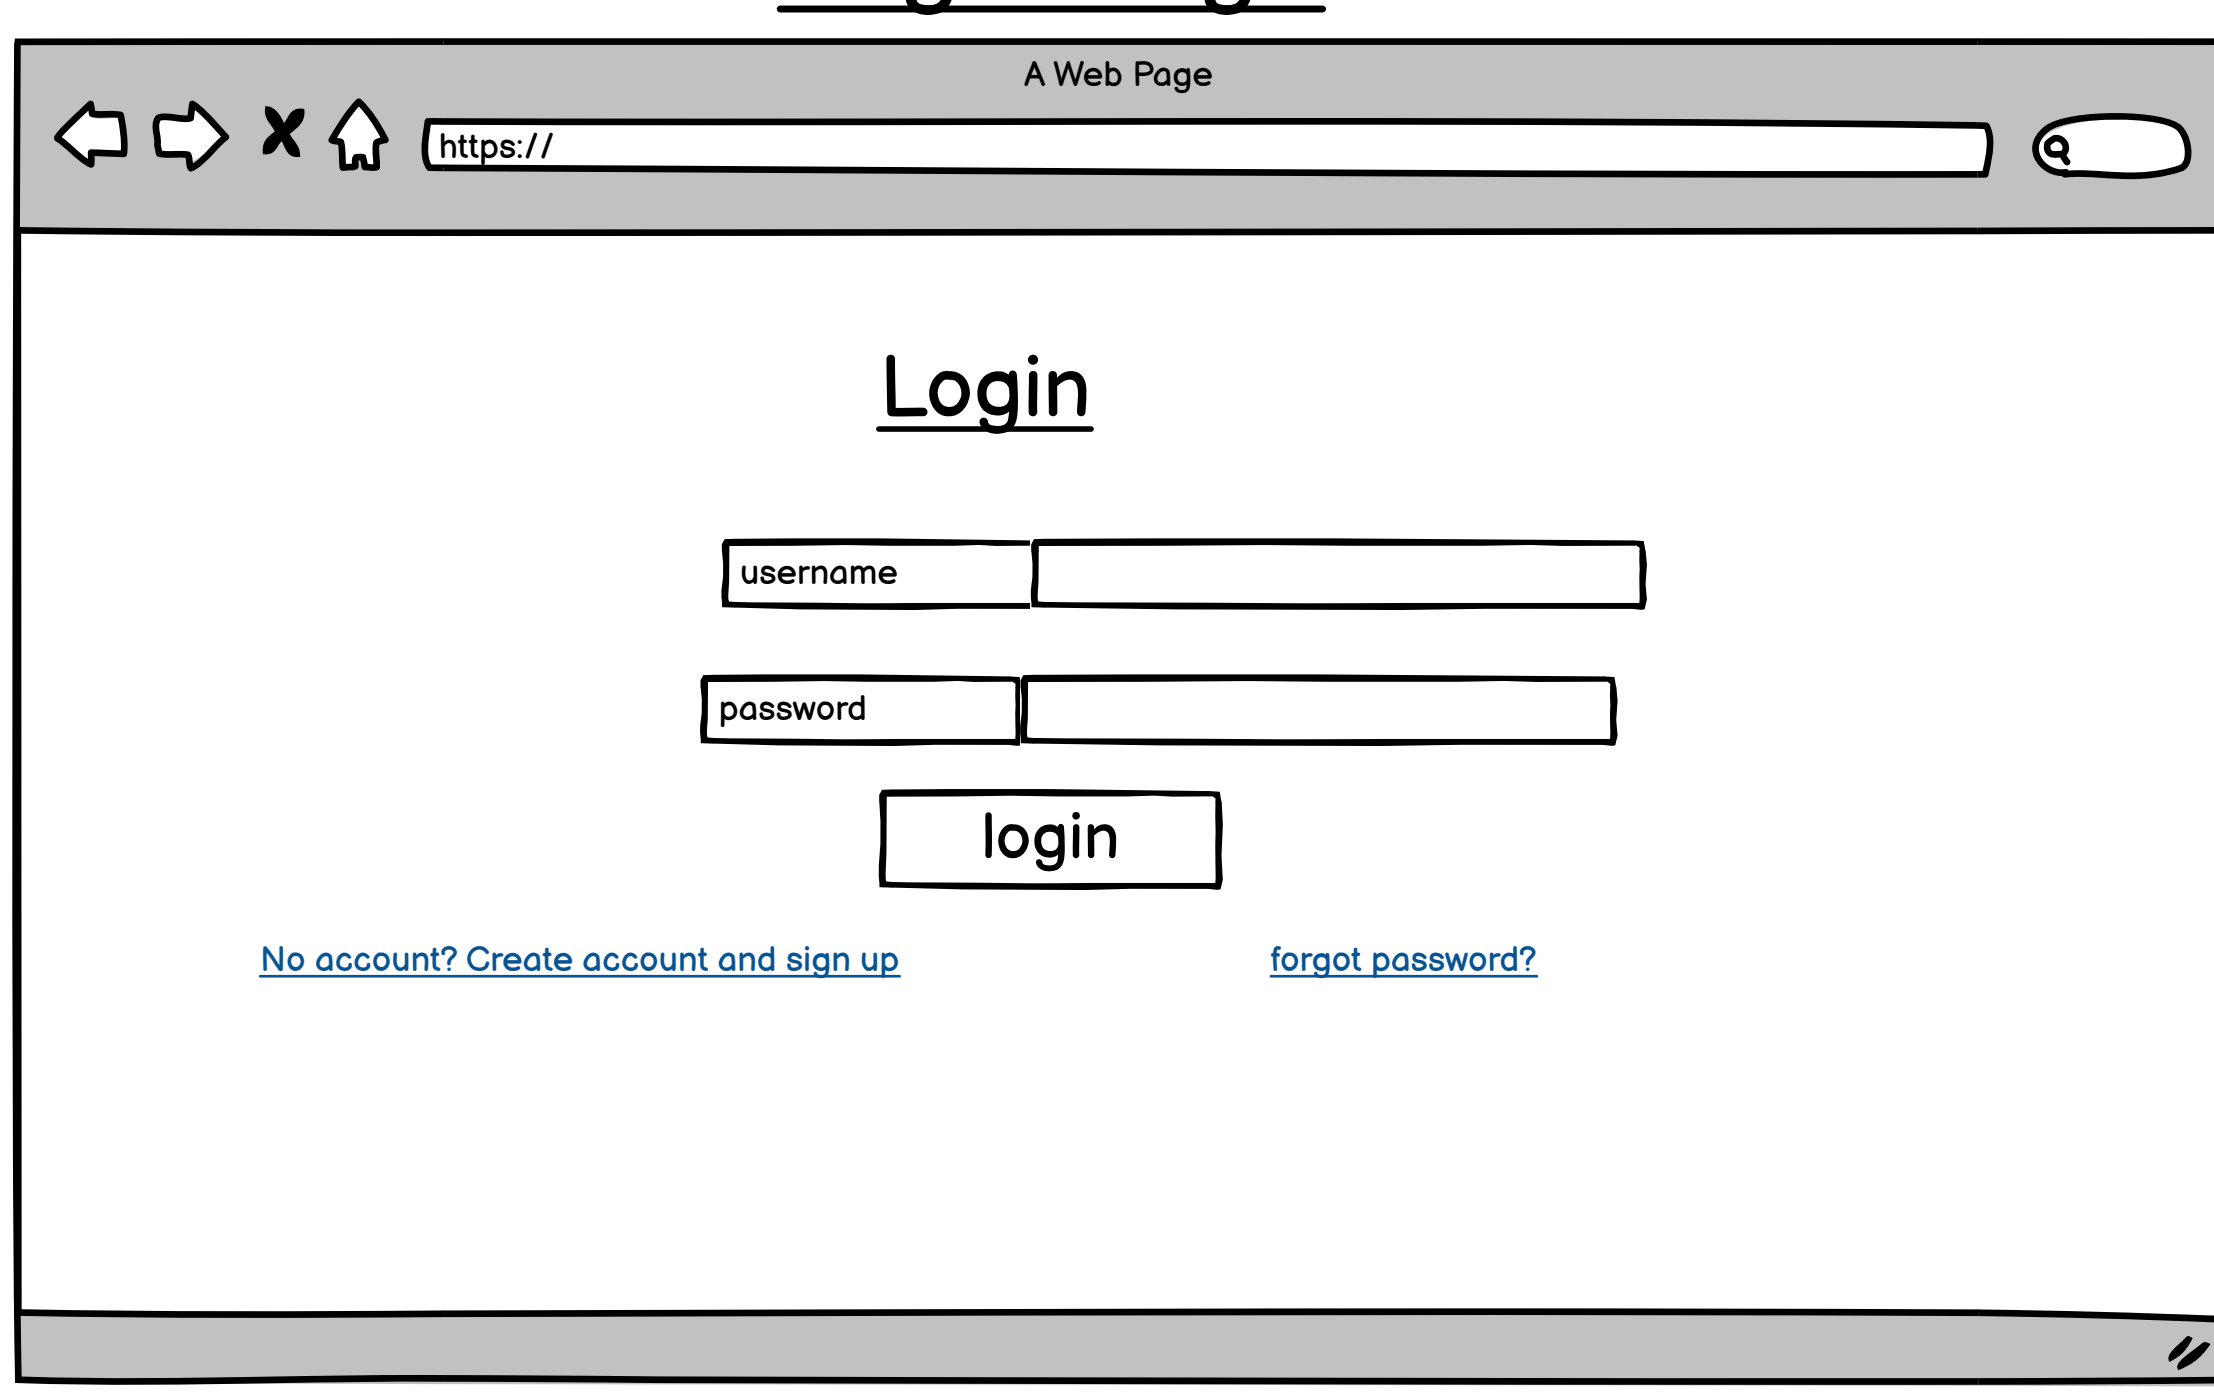

## Product page

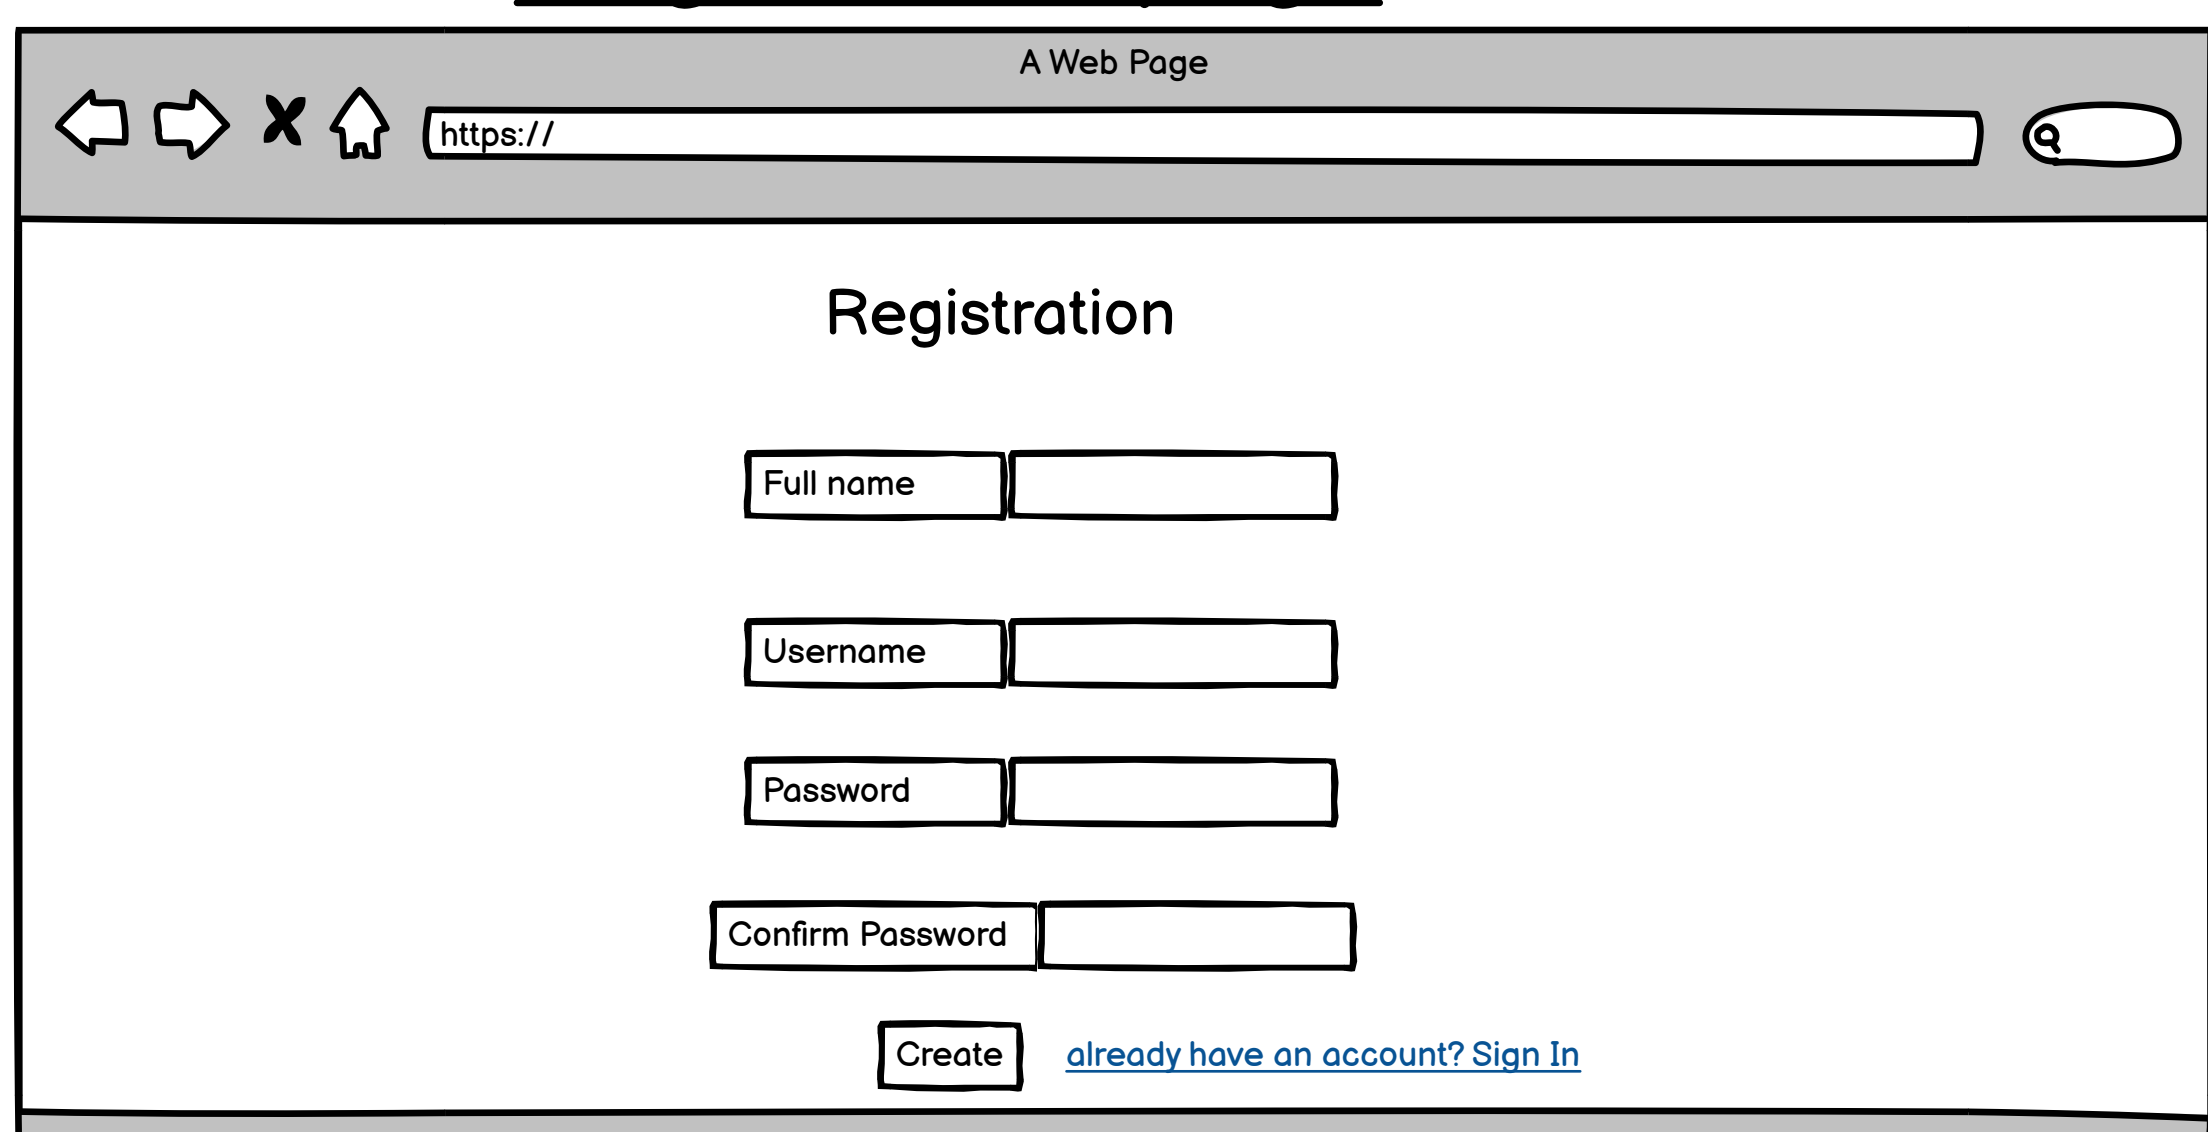

## Checkout page design

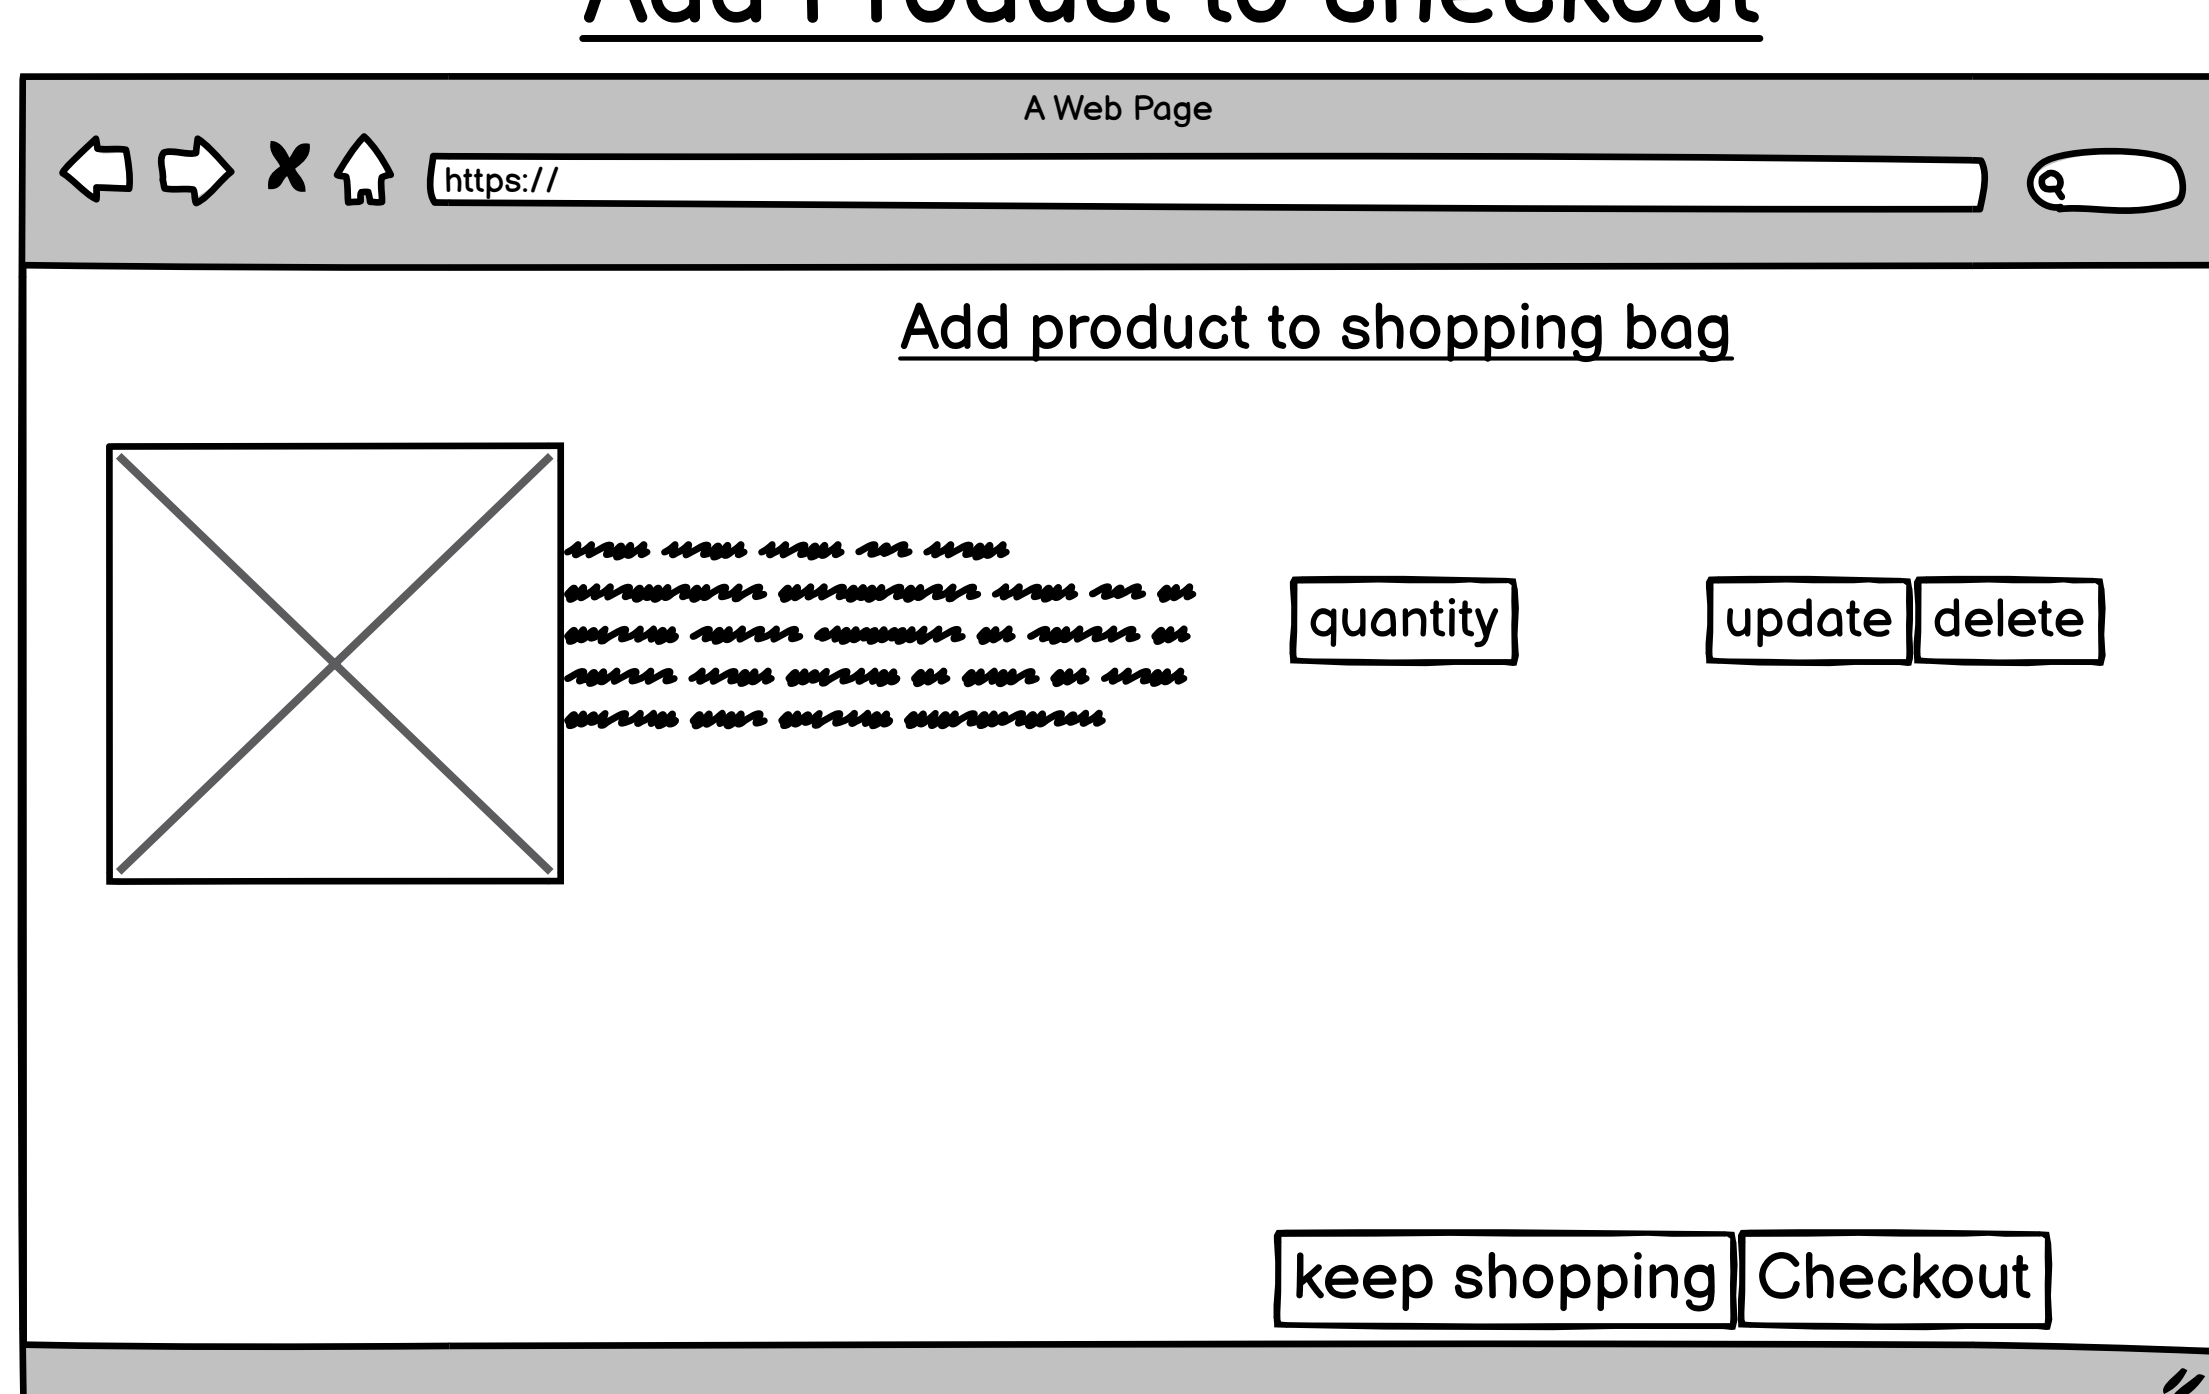

## Login Page

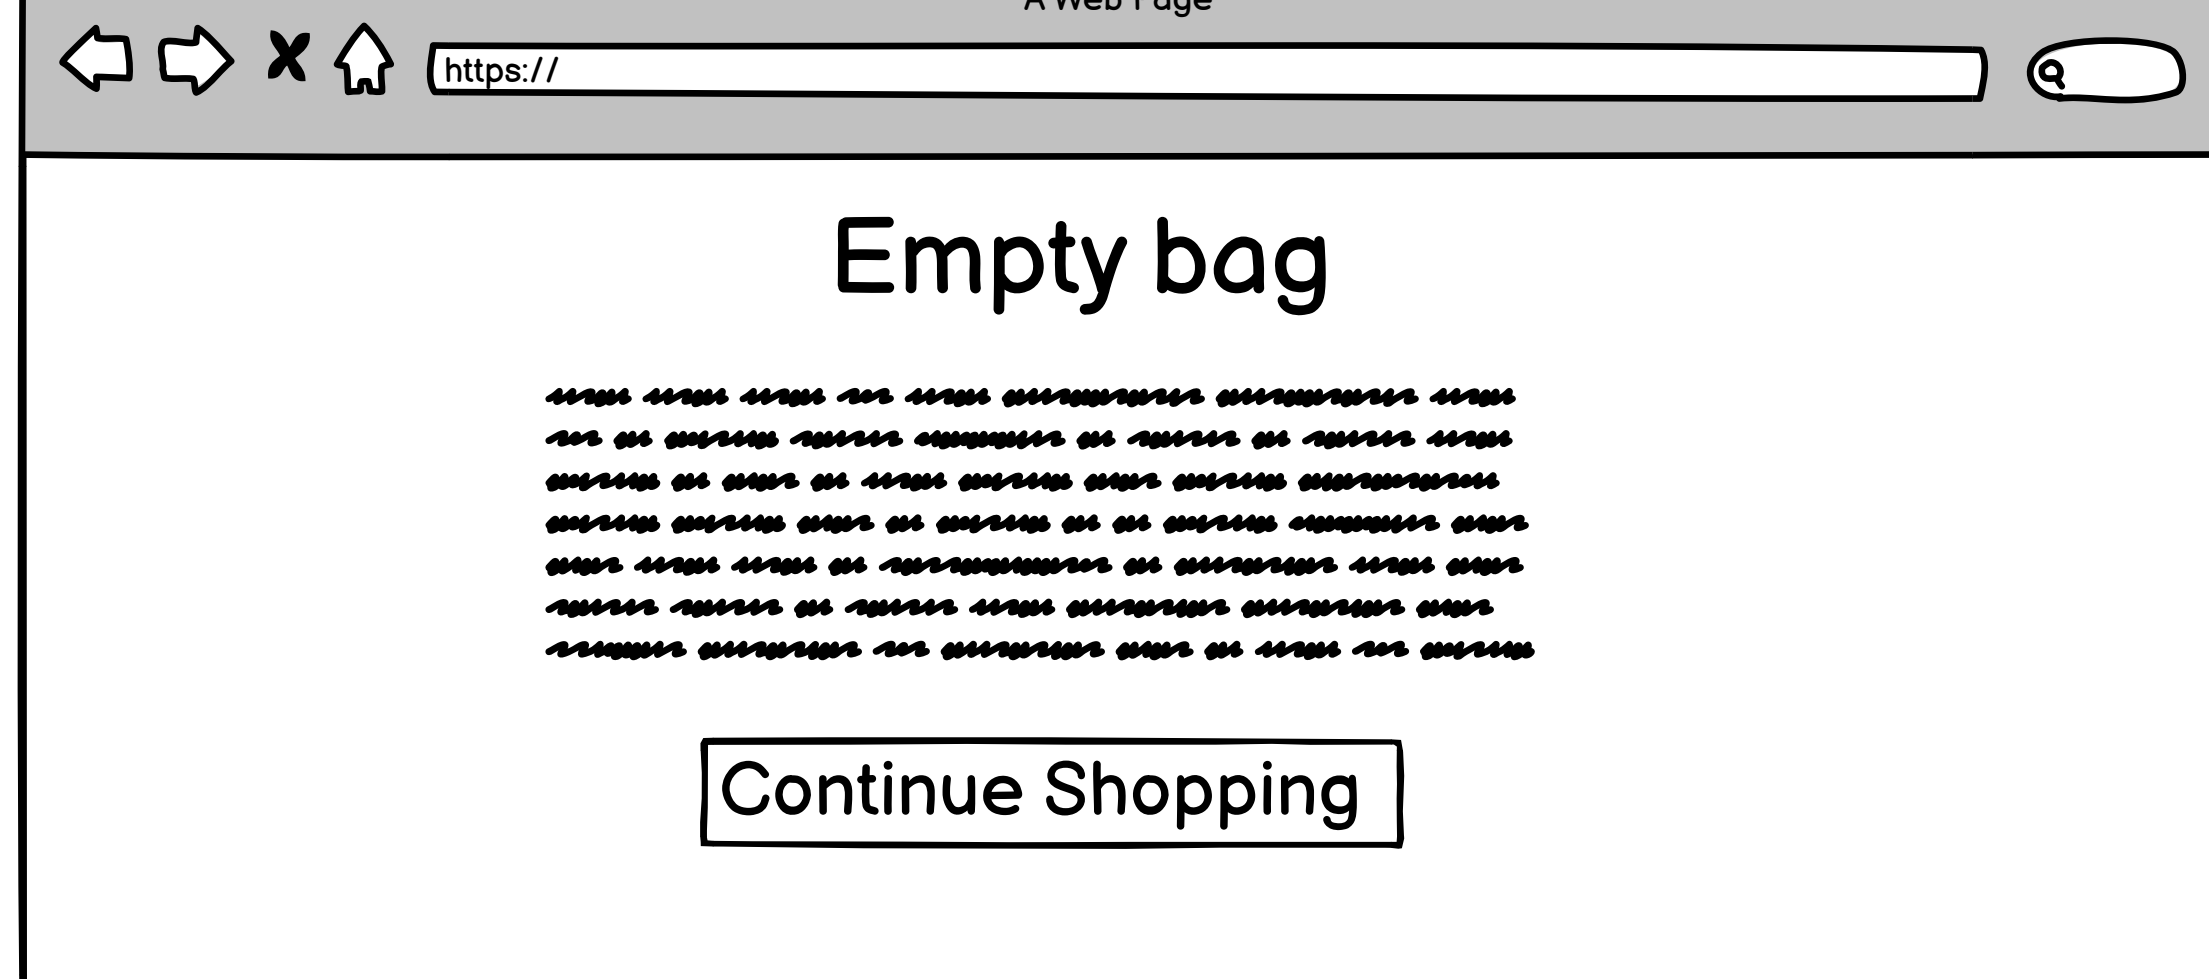

## Registration page

## Add Product to checkout

## Empty bag

## Conclusion

For my final project, i would like to mention that the project will be from the Code Institute tutorials because it was interesting to learn and i have learned a lot on what i should do to create a perfect ecommerce website. However, it will include adding Stripe and AWS in which they are really important. Hopefully i hope to make sure that the website that i create is simple and straight forward. I am glad that i have learned a lot about full stack development and it was a pleasure to go through the course because it was interesting and challenging for me.
